                                                                                                                                                                                                                                                                                                                                                                                               OSF-2 plays an important role in the formation of bone, by acting a growth factor or adhesion or "guiding" protein to attract cells to the site of bone induction. In a pharmaceutical compsn. it can be applied in metabolic bone diseases.

The gene and its product may be used to detect tumours in blood, urine or sputum. Inhibitors of TCI are used to treat late stage cancers and for preventing tumour cell metastasis. Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
